

- ◆ Rising seas will cause Bangladesh alone to lose 17 percent of its land. That's equal to the U.S. losing Alabama, Tennessee, Kentucky, Ohio, and every inch of land to the East.
  - ◆ Changes in climate can create massive droughts. One estimate says crops could be reduced to a half in Nigeria.
  - ◆ Water flow to the Indus River could drop off by about 1/3 as glaciers melt. India and Pakistan, which have had 4 wars since the 1940s, will have to share this shrinking amount of water. At issue is life and death for tens of millions on both sides of the border—and both countries have nuclear weapons.
- Again this is what will happen with just a 2 degree increase, not the **3.6 degrees now predicted by the IEA.**
- Do we have to be convinced? Typhoon Haiyan, the strongest storm in history, Hurricane Sandy, the Frankenstorm, the floods in Alberta, Canada...all these once in a century storms happening again and again. Scientists predicted that warming ocean means more powerful storms and they've been shown to be right.

The problem is despite all the “green” chatter from politicians and capitalists, they're tearing up the earth and burning as much gas, oil and coal as they can get our hands on.

They haven't even decided to cancel the Keystone XL pipeline which would bring to market the dirtiest, carbon rich fuel on the planet

We've got to drastically, drastically cut back on the use of fossil fuel and move to solar, wind, geothermal and other renewable energies. We've got to tax the hell out of fossil fuels. We've got to become super-efficient in what we use and we've got to travel less and consume less.

This is not all a pipe dream. There are ways we can go to 100% renewable energy in less than twenty years. Yet those who believe in the cult of the “free market” won't take the necessary action. We have to overcome the chaos of the “market” and take control of the world's resources and use them in a planned and rational way. Put everyone to work to fight the growing climate crisis.

The time is short.

**Replace the Capitalist Casino with  
Something that Works for All of Us**

- ◆ Global warming is set to heat up with temperatures rising to nearly twice targets set by the United Nations. That was the warning given by the International Energy Agency (IEA) on 11/12/13.
- ◆ That is terrifying news because even the U.N. target increase of 2 degrees Celsius would have terrible effects. Yet now we know if we don't do something soon it will be much, much worse.
- ◆ The IEA says greenhouse gas emissions will rise by 20 percent by 2035, putting the world on track for a temperature increase of 3.6 degrees. To give you an idea how bad that might be consider the book “Overheated”.
- ◆ In February of 2013 Andrew Guzman published that book to explain the effects of global warming. Guzman is an economist and a lawyer. In the book he tried to explain how bad it will be if we hold the increase to *only 2 degrees*.
- ◆ These are a few of the things he says will happen.
- ◆ Flooding will push people to crowded cities or refugee camps, creating ripe conditions for the spread of diseases. It could lead to a global epidemic similar to the 1918 Spanish Flu that killed 3 out of every 100 people in the world.
- ◆ California's Sierra Snowpack, its most important water source, will have shrunk by a third by 2050. No plan exists

# A New Warning of Catastrophe
